01 / INTERVIEW SYNTHESIS

Synthesize invented extracts transparently.

Figure 1 / fictional illustration, not evidence / curated image source in provenance.json

This report demonstrates qualitative synthesis using six authored example extracts. No interviews were conducted, and the text contains no actual participants, consent records or personal data.

The extracts concern finding and interpreting a fictional prompt card. Nine tag assignments cover four themes because an extract can receive more than one tag. Six extracts and nine tags must not be presented as nine people or as a representative study.

Analyst record / trace the source

Separate the supplied synthetic result from your interpretation and any real-world evidence still needed.

INVENTED MATERIAL

6 extracts / 0 actual interviews

MULTI-LABEL CODING

9 assignments across 4 themes

Synthesis question	Record synthesis question and its source boundary.
Material unit	Record material unit and its source boundary.
Research boundary	Record research boundary and its source boundary.

What should a reader know before interpreting any theme in this report?

02 / INTERVIEW SYNTHESIS

Describe the inquiry guide.

Figure 1 / fictional illustration, not evidence / curated image source in provenance.json

A guide states what a real conversation might explore without implying that those questions have already been asked. Here the guide is a proposed scaffold for interpreting the invented examples.

Possible questions concern locating a current card, recognising a revision and asking for clarification. A genuine interview study would require appropriate context, recruitment, consent and review. None of those activities is supplied by the example text.

Analyst record / trace the source

Separate the supplied synthetic result from your interpretation and any real-world evidence still needed.

INVENTED MATERIAL
6 extracts / 0 actual interviews

MULTI-LABEL CODING
9 assignments across 4 themes

Inquiry focus	Record inquiry focus and its source boundary.
Possible prompt	Record possible prompt and its source boundary.
Research not performed	Record research not performed and its source boundary.

Which guide question would need revision for a different real context?

03 / INTERVIEW SYNTHESIS

Keep the material unit honest.

Figure 2 / fictional illustration, not evidence / curated image source in provenance.json

E1–E6 identify six invented extracts, not six interviewees. The source intentionally contains no demographic attributes or participant identifiers.

A real synthesis would explain how material was produced and selected. Here the full set is authored for the template, so it can illustrate coding mechanics but cannot support claims about prevalence, saturation, needs or experiences of actual people.

Analyst record / trace the source

Separate the supplied synthetic result from your interpretation and any real-world evidence still needed.

INVENTED MATERIAL

6 extracts / 0 actual interviews

MULTI-LABEL CODING

9 assignments across 4 themes

Extract unit	Record extract unit and its source boundary.
Selection boundary	Record selection boundary and its source boundary.
Unsupported inference	Record unsupported inference and its source boundary.

What would become misleading if the extract identifiers were labelled participant IDs?

04 / INTERVIEW SYNTHESIS

Preserve an inspectable extract index.

Figure 2 / fictional illustration, not evidence / curated image source in provenance.json

Keep the wording beside its identifier so another reader can trace a theme back to the actual example. Quotations should remain visibly labelled as invented.

E1 says a current card can be found when its version is visible. E2 describes asking another reader when two cards look similar. These short examples are not testimonials or findings collected from a real service.

Analyst record / trace the source

Separate the supplied synthetic result from your interpretation and any real-world evidence still needed.

INVENTED MATERIAL
6 extracts / 0 actual interviews

MULTI-LABEL CODING
9 assignments across 4 themes

Extract identifier	Record extract identifier and its source boundary.
Exact wording	Record exact wording and its source boundary.
Context limitation	Record context limitation and its source boundary.

Which contextual detail would you need before interpreting a genuine quotation?

05 / INTERVIEW SYNTHESIS

Make coding choices visible.

Figure 3 / fictional illustration, not evidence / curated image source in provenance.json

A code links a passage to an analytic label. It is a decision by the analyst, not a fact automatically contained in the words. The exported source records every stipulated tag.

The codebook uses findability, clarification, version and example. E1 receives findability and version; E2 receives findability and clarification. Multiple coding explains why theme assignments outnumber extracts. No independent coder agreement is supplied.

Analyst record / trace the source

Separate the supplied synthetic result from your interpretation and any real-world evidence still needed.

INVENTED MATERIAL
6 extracts / 0 actual interviews

MULTI-LABEL CODING
9 assignments across 4 themes

Code label	Record code label and its source boundary.
Relevant passage	Record relevant passage and its source boundary.
Coding reason	Record coding reason and its source boundary.

Where could a reasonable second reader choose a different code?

06 / INTERVIEW SYNTHESIS

Cluster without ranking needs.

Figure 3 / fictional illustration, not evidence / curated image source in provenance.json

Findability appears in E1, E2 and E6; clarification in E2, E3 and E5; version in E1 and E4; example in E3. The counts are 3, 3, 2 and 1.

Those nine assignments describe this authored coding table only. They do not rank real user needs or estimate how common a view is. Preserve the source identifiers with each theme rather than treating the largest count as a validated priority.

Analyst record / trace the source

Separate the supplied synthetic result from your interpretation and any real-world evidence still needed.

INVENTED MATERIAL
6 extracts / 0 actual interviews

MULTI-LABEL CODING
9 assignments across 4 themes

Theme	Record theme and its source boundary.
Supporting extracts	Record supporting extracts and its source boundary.
Interpretation limit	Record interpretation limit and its source boundary.

Why would the theme counts be insufficient to choose a real product priority?

07 / INTERVIEW SYNTHESIS

Keep contrasting situations visible.

Figure 4 / fictional illustration, not evidence / curated image source in provenance.json

An extract about identifying a version differs from one about asking another person for clarification. Both may concern interpretation, but collapsing them can hide the different situations described.

E4 refers to keeping an earlier version for comparison. E5 asks whom to approach about an unfamiliar term. The contrast suggests questions about change visibility and help routes, not findings about actual behaviours or preferences.

Analyst record / trace the source

Separate the supplied synthetic result from your interpretation and any real-world evidence still needed.

INVENTED MATERIAL

6 extracts / 0 actual interviews

MULTI-LABEL CODING

9 assignments across 4 themes

Contrasting extract A	Record contrasting extract a and its source boundary.
Contrasting extract B	Record contrasting extract b and its source boundary.
Analytic question	Record analytic question and its source boundary.

What distinction would disappear if every extract became a generic request for clarity?

08 / INTERVIEW SYNTHESIS

Record the analyst’s influence.

Figure 4 / fictional illustration, not evidence / curated image source in provenance.json

A reflexive note identifies how the question and codebook shape the synthesis. In this teaching set, the same author created the extracts and the tags, so the grouping cannot be treated as independent evidence.

The decision to use findability as a code makes certain phrases more visible. A different question could lead to a different grouping. State that influence directly rather than presenting the theme map as the only possible reading.

Analyst record / trace the source

Separate the supplied synthetic result from your interpretation and any real-world evidence still needed.

INVENTED MATERIAL

6 extracts / 0 actual interviews

MULTI-LABEL CODING

9 assignments across 4 themes

Analyst choice	Record analyst choice and its source boundary.
Possible alternative	Record possible alternative and its source boundary.
Effect on synthesis	Record effect on synthesis and its source boundary.

Which coding choice most strongly shapes the report’s story?

09 / INTERVIEW SYNTHESIS

State the finding boundary.

Figure 5 / fictional illustration, not evidence / curated image source in provenance.json

A useful exercise synthesis describes an interpretation of the examples and the question it raises. It should not claim actual research insights, validated needs or a tested service improvement.

A bounded statement is that the six invented extracts illustrate several ways to discuss card interpretation: finding, clarifying, recognising versions and using examples. The statement remains about the teaching material, not about real readers.

Analyst record / trace the source

Separate the supplied synthetic result from your interpretation and any real-world evidence still needed.

INVENTED MATERIAL
6 extracts / 0 actual interviews

MULTI-LABEL CODING
9 assignments across 4 themes

Bounded synthesis	Record bounded synthesis and its source boundary.
Source trace	Record source trace and its source boundary.
Claim not supported	Record claim not supported and its source boundary.

Which phrase would accidentally turn an illustrative theme into an empirical finding?

10 / INTERVIEW SYNTHESIS

Turn themes into questions to verify.

Figure 5 / fictional illustration, not evidence / curated image source in provenance.json

Finish with questions that could be investigated through appropriate real methods. Keep the invented extract export and analytic limitations with the report.

A future inquiry might examine when a version label matters and which help route fits a defined context. That inquiry would require its own suitable design and permissions. This template has not recruited, interviewed or studied anyone.

Analyst record / trace the source

Separate the supplied synthetic result from your interpretation and any real-world evidence still needed.

INVENTED MATERIAL
6 extracts / 0 actual interviews

MULTI-LABEL CODING
9 assignments across 4 themes

Verification question	Record verification question and its source boundary.
Appropriate next source	Record appropriate next source and its source boundary.
Handoff artifact	Record handoff artifact and its source boundary.

What evidence would be needed before acting on this theme map?
