01 / QUESTION LAB

Start with a noticed difference.

Figure 1 / fictional illustration, not evidence / curated image source in provenance.json

This inquiry course practises moving from a visible detail to a question that can be investigated. Use the fictional library scene as a prompt, not as research evidence.

An adult learner notices two differently coloured notebooks. The colour is visible; who uses them and why are unknown. The first task is to keep those statements separate.

Observation → question → assumption → evidence → revision

Working record: Record two visible details and one thing the picture cannot tell you. Keep your first attempt and your revised version so the change remains visible.

↳ Observation → question → assumption → evidence → revision

Write your observation → question → assumption → evidence → revision here.

Record two visible details and one thing the picture cannot tell you.

02 / QUESTION LAB

Build a question tree.

Figure 1 / fictional illustration, not evidence / curated image source in provenance.json

Put one broad curiosity at the root and divide it into smaller questions. Each branch should ask for a different kind of information rather than repeat the same judgement.

Root: how might a study corner support discussion? Branches might concern the purpose of the session, the material people use and how they choose a place to sit. None is established by a picture.

Root question / three branches / one selected leaf

Working record: Write a root question, three branches and the narrowest question worth pursuing first. Keep your first attempt and your revised version so the change remains visible.

↳ **Root question**	Write your root question here.
↳ **three branches**	Write your three branches here.
↳ **one selected leaf**	Write your one selected leaf here.

Write a root question, three branches and the narrowest question worth pursuing first.

03 / QUESTION LAB

Make an assumption card.

Figure 2 / fictional illustration, not evidence / curated image source in provenance.json

An assumption is a provisional explanation, not a finding. Give it a short name and record what you expect to observe if it were useful.

Assumption A: a shared sketch might help a discussion stay focused. A possible observation is whether speakers refer to the same sketch. Other explanations, such as a facilitator prompt, must remain visible.

Assumption / expected observation / alternative explanation

Working record: Complete one card without using the words proven or always. Keep your first attempt and your revised version so the change remains visible.

↳ **Assumption**	Write your assumption here.
↳ **expected observation**	Write your expected observation here.
↳ **alternative explanation**	Write your alternative explanation here.

Complete one card without using the words proven or always.

04 / QUESTION LAB

Request the evidence you need.

Figure 2 / fictional illustration, not evidence / curated image source in provenance.json

A useful evidence request names the question, the kind of material required and the limit of what that material could support. Do not collect personal data for this exercise.

For the shared-sketch question, an invented transcript with references to objects would be more relevant than a photograph of an attractive room. A transcript still would not establish a causal effect.

Question / source type / relevance / limitation

Working record: Write an evidence request that another learner could understand without seeing your notes. Keep your first attempt and your revised version so the change remains visible.

↳ **Question**	Write your question here.
↳ **source type**	Write your source type here.
↳ **relevance**	Write your relevance here.
↳ **limitation**	Write your limitation here.

Write an evidence request that another learner could understand without seeing your notes.

05 / QUESTION LAB

Try a paper experiment.

Figure 3 / fictional illustration, not evidence / curated image source in provenance.json

Use two short invented dialogue extracts to practise applying the same rule. This is a desk exercise in consistent reading, not an experiment involving real participants.

Extract A: I mean the left-hand shape. Extract B: I prefer this version. Code whether each sentence explicitly refers to a shared object. Keep the original wording beside your code.

Extract / coding rule / code / uncertainty

Working record: Apply one coding rule to both extracts and flag any ambiguous phrase. Keep your first attempt and your revised version so the change remains visible.

↳ **Extract**	Write your extract here.
↳ **coding rule**	Write your coding rule here.
↳ **code**	Write your code here.
↳ **uncertainty**	Write your uncertainty here.

Apply one coding rule to both extracts and flag any ambiguous phrase.

06 / QUESTION LAB

Compare without inventing a winner.

Figure 3 / fictional illustration, not evidence / curated image source in provenance.json

A comparison should show the criterion before the judgement. If the material is too thin, an unresolved result is more useful than a confident ranking.

Sentence A names a shape; sentence B names a preference. That difference supports a description of the sentences, not a conclusion about which group learned more.

Criterion / example A / example B / bounded conclusion

Working record: Write a comparison that stays within what the two extracts actually contain. Keep your first attempt and your revised version so the change remains visible.

↳ **Criterion**	Write your criterion here.
↳ **example A**	Write your example a here.
↳ **example B**	Write your example b here.
↳ **bounded conclusion**	Write your bounded conclusion here.

Write a comparison that stays within what the two extracts actually contain.

07 / QUESTION LAB

Invite a challenge.

Figure 4 / fictional illustration, not evidence / curated image source in provenance.json

Peer feedback should identify a claim, ask which material supports it and offer one alternative reading. The aim is to improve the inquiry rather than evaluate a person.

A peer might ask whether left-hand refers to a shared diagram or only the speaker’s page. That question exposes a missing context which the coding rule should acknowledge.

Claim under review / challenge / missing context

Working record: Write one generous challenge and the exact passage it addresses. Keep your first attempt and your revised version so the change remains visible.

↳ **Claim under review**	Write your claim under review here.
↳ **challenge**	Write your challenge here.
↳ **missing context**	Write your missing context here.

Write one generous challenge and the exact passage it addresses.

08 / QUESTION LAB

Show your revision.

Figure 4 / fictional illustration, not evidence / curated image source in provenance.json

Keep the earlier wording visible beside the revision so a reader can see which assumption changed. Revision is a traceable decision rather than a replacement of the record.

Earlier: the shared sketch improved discussion. Revised: one invented sentence explicitly names a shape, while the setting and effect on discussion remain unknown.

Before / reason for change / after

Working record: Revise one claim and name the evidence boundary that prompted the change. Keep your first attempt and your revised version so the change remains visible.

↳ **Before**	Write your before here.
↳ **reason for change**	Write your reason for change here.
↳ **after**	Write your after here.

Revise one claim and name the evidence boundary that prompted the change.

09 / QUESTION LAB

Transfer the method.

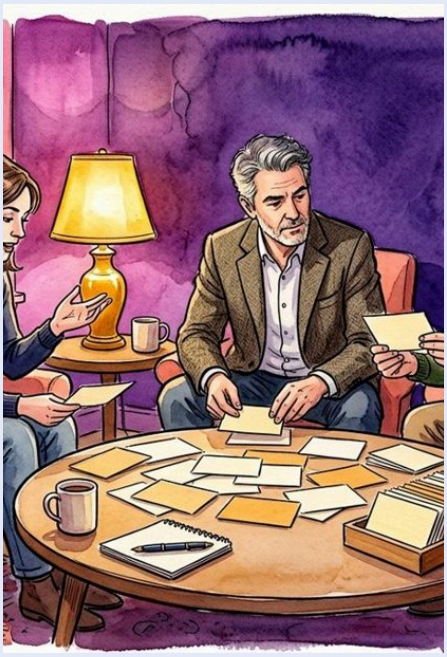

Figure 5 / fictional illustration, not evidence / curated image source in provenance.json

Apply the inquiry sequence to a different fictional scene. Transfer means retaining the reasoning steps while changing the subject, not copying the previous conclusion.

In a courtyard illustration, a learner notices an empty chair. Start with a question about what context is missing; do not infer low attendance, exclusion or preference from the empty seat.

New detail / new question / source request

Working record: Draft a fresh question tree for an object outside the library example. Keep your first attempt and your revised version so the change remains visible.

↳ **New detail**	Write your new detail here.
↳ **new question**	Write your new question here.
↳ **source request**	Write your source request here.

Draft a fresh question tree for an object outside the library example.

10 / QUESTION LAB

Keep an inquiry record.

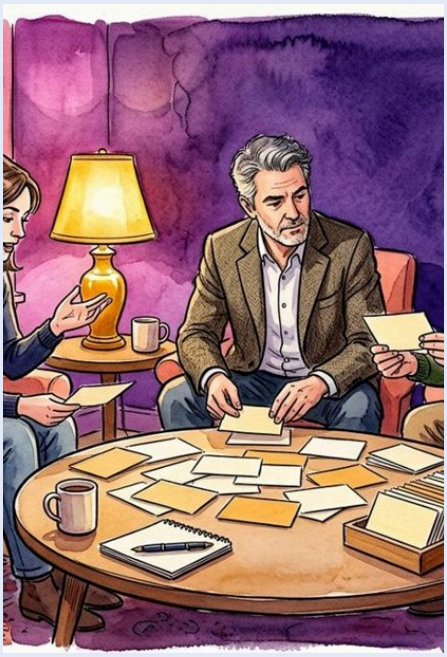

Figure 5 / fictional illustration, not evidence / curated image source in provenance.json

Finish with a compact account of the route you took: noticed detail, selected question, assumption, source request and revised claim. A useful record includes an unresolved question.

This course provides no grade or accredited qualification. Its outcome is a more inspectable piece of reasoning and a clear account of which evidence you still do not have.

Detail / question / assumption / revision / next source

Working record: Choose the strongest revision in your record and explain why it is more careful. Keep your first attempt and your revised version so the change remains visible.

↳ **Detail**	Write your detail here.
↳ **question**	Write your question here.
↳ **assumption**	Write your assumption here.
↳ **revision**	Write your revision here.
↳ **next source**	Write your next source here.

Choose the strongest revision in your record and explain why it is more careful.
