01 / COMPARISON GUIDE

Start with the decision task.

ASSUMED OPTION

sequence-folio

COMPARISON MODEL

3 concepts × 4 flags / 8 yes cells / not verified products.

NEED / OPTION / CONDITION

Task	Return to material with enough context to use it.
Decision scope	Compare fictional organising approaches.
Non-goal	No ranking of actual vendors or products.

What must the chosen approach help the reader do?

Choose a way to keep working material understandable when you return to it. This guide compares three fictional approaches, not real competing products.

Begin with the task and the constraints that would make an option unsuitable. The point is to expose trade-offs, not to manufacture a winner or imply that a larger feature count means greater value.

Decision before feature counting

The comparison uses authored assumptions. Validate any real product capability and procurement requirement independently before adapting the guide.

02 / COMPARISON GUIDE

Turn needs into checkable criteria.

ASSUMED OPTION

context-card-box

COMPARISON MODEL

3 concepts × 4 flags / 8 yes cells / not verified products.

NEED / OPTION / CONDITION

Essential	Define the task condition that cannot be compromised.
Preference	Record a benefit that may be traded off.
Unknown	Check requirements that the current model does not address.

Which requirement would rule out an otherwise appealing option?

A useful criterion describes a task condition: keep an order, add a context note, or carry a small set of material without a network connection.

Separate essential constraints from preferences. A reader may care more about portability than indexing, while another may need a clear review trail. Those differences should remain visible rather than disappear inside an unexplained score.

Needs without arbitrary weights

The guide supplies four binary assumptions for illustration. It does not assign importance on behalf of a buyer or claim that the assumptions are verified.

Figure 1 / fictional illustration, not evidence / curated image source in provenance.json

03 / COMPARISON GUIDE

Use the same comparison rules.

ASSUMED OPTION

review-binder

COMPARISON MODEL

3 concepts × 4 flags / 8 yes cells / not verified products.

NEED / OPTION / CONDITION

Yes	Assumed present in this illustrative concept.
No	Assumed absent, not a verified product limitation.
Unknown real fact	Requires checking; do not replace it with a model flag.

Would another reviewer interpret each flag the same way?

The three concepts are a sequence folio, a context-card box and a review binder. Each is described using the same four capability assumptions.

A yes means assumed present in this fictional model; a no means assumed absent. Neither means independently tested, universally available or unsuitable for every reader. Unknown real-world facts must not be silently converted into no.

A visible comparison key

The four dimensions are sequence, context note, portable set and review trail. They are not a comprehensive product specification.

Figure 2 / fictional illustration, not evidence / curated image source in provenance.json

04 / COMPARISON GUIDE

Describe the options in plain language.

ASSUMED OPTION

sequence-folio

COMPARISON MODEL

3 concepts × 4 flags / 8 yes cells / not verified products.

NEED / OPTION / CONDITION

Sequence folio	Ordered material with a portable set.
Context-card box	Context notes with a portable set.
Review binder	Ordered material, context notes and a review trail.

Which organising priority matches the task rather than the headline?

The sequence folio keeps material in an intended order. The context-card box emphasises a question beside a note. The review binder keeps a structured review trail.

These are design concepts, not offers for sale. Their descriptions explain a comparison lens without implying construction quality, security, support or compatibility.

Three different organising priorities

A useful description helps the reader picture the task. Keep promotional superlatives out of a guide that is meant to support a considered choice.

Figure 2 / fictional illustration, not evidence / curated image source in provenance.json

05 / COMPARISON GUIDE

Read the matrix without a score.

ASSUMED OPTION

context-card-box

COMPARISON MODEL

3 concepts × 4 flags / 8 yes cells / not verified products.

NEED / OPTION / CONDITION

Sequence folio	Sequence, portable set and review trail assumed.
Context-card box	Context note and portable set assumed.
Review binder	Sequence, context note and review trail assumed.

Which individual flag matters to this reader's task?

The fictional matrix contains eight yes flags across twelve cells. The total describes the model only; it is not a quality rating or a market statistic.

Sequence folio has sequence, portable set and review trail. Context-card box has context note and portable set. Review binder has sequence, context note and review trail, but not portable set. These are authored assumptions, not tested product capabilities.

Assumptions are inspectable

Check source CSV or JSON for every flag. Do not add a feature to the narrative without changing the source register and rebuilding the guide.

Figure 3 / fictional illustration, not evidence / curated image source in provenance.json

06 / COMPARISON GUIDE

Match a scenario before recommending.

ASSUMED OPTION

review-binder

COMPARISON MODEL

3 concepts × 4 flags / 8 yes cells / not verified products.

NEED / OPTION / CONDITION

Carry a small set	Check the portable-set assumption first.
Recover the reason	Check the context-note assumption first.
Review a sequence	Check sequence and review-trail assumptions together.

Which scenario is closest to the actual task?

For a person carrying a small set of references, portability may matter first. For a person explaining why a passage was saved, a context note may matter more.

The scenarios show how priorities change the conversation. They do not establish a universally best option. A real recommendation needs actual constraints, verified capabilities and the reader's informed judgement.

Scenario routes

Use a scenario to ask what would happen in practice. If two options remain plausible, identify the smallest appropriate comparison activity.

Figure 3 / fictional illustration, not evidence / curated image source in provenance.json

07 / COMPARISON GUIDE

Treat cost as an unanswered question.

ASSUMED OPTION

sequence-folio

COMPARISON MODEL

3 concepts × 4 flags / 8 yes cells / not verified products.

NEED / OPTION / CONDITION

Purchase terms	No price or commercial offer supplied.
Ongoing effort	Setup and maintenance need investigation.
Comparison boundary	Capability flags do not establish total cost.

Which ongoing responsibility could change the cost conversation?

No prices, implementation effort or support conditions are supplied. A lower apparent purchase price would not by itself establish lower total cost.

Ask about setup, maintenance, storage, accessibility and the work of changing an existing practice. Keep monetary amounts unknown until an appropriate, current source supports them.

Commercial information not supplied

The source model contains capabilities only. It cannot justify an affordability claim, a savings figure or a procurement budget.

Figure 4 / fictional illustration, not evidence / curated image source in provenance.json

08 / COMPARISON GUIDE

Make omissions visible.

ASSUMED OPTION

context-card-box

COMPARISON MODEL

3 concepts × 4 flags / 8 yes cells / not verified products.

NEED / OPTION / CONDITION

Unassessed	Durability and accessibility are not evaluated.
Unverified	No actual product, vendor or test result supplied.
Pause condition	An essential requirement lacks appropriate evidence.

Which missing dimension should prevent a decision today?

The model says nothing about durability, privacy, accessibility or specialist requirements. Those omissions may matter more than the four displayed dimensions.

A comparison guide should tell a reader what it does not cover. Do not use a neat matrix to imply a complete assessment, certification or suitability decision.

Unassessed dimensions

If an omitted condition is essential, pause the choice and obtain the relevant information. A blank in the evidence is not permission to assume a favourable answer.

Figure 4 / fictional illustration, not evidence / curated image source in provenance.json

09 / COMPARISON GUIDE

Write a provisional choice record.

ASSUMED OPTION

review-binder

COMPARISON MODEL

3 concepts × 4 flags / 8 yes cells / not verified products.

NEED / OPTION / CONDITION

Task condition	A portable set is essential for this scenario.
Options to inspect	Sequence folio and context-card box remain plausible.
Open condition	Verify actual context and review requirements.

What new fact would cause this provisional choice to change?

A good decision record states the task, the option considered and the unresolved condition that could change the choice. It need not pretend certainty.

Use the three fields below as a working decision note. The example favours no real product and does not replace organisational procurement, specialist review or a buyer's own evaluation.

A choice that can be revisited

Keep the evidence version with the record. If an assumed capability changes, revisit the reasoning rather than preserving the old conclusion for consistency.

Figure 5 / fictional illustration, not evidence / curated image source in provenance.json

10 / COMPARISON GUIDE

Ask for the missing information.

ASSUMED OPTION

sequence-folio

COMPARISON MODEL

3 concepts × 4 flags / 8 yes cells / not verified products.

NEED / OPTION / CONDITION

Question to send	Show how the option handles this specific task.
Evidence to request	Current capability information and relevant conditions.
Commitment boundary	No purchase or procurement approval established.

What demonstration would reduce the most important uncertainty?

Before committing, ask a provider or maker to demonstrate the exact task and explain the limits of the proposed option. Request current, attributable information.

This guide supplies no live consultation destination or purchasing service. Use its questions to structure a real evaluation, and preserve the distinction between an authored model and verified product evidence.

Next-step conversation

A useful enquiry describes the task and the unresolved criterion. Avoid asking only whether an option is best, because the comparison has not defined a universal winner.
