01 / DISCOVERY MAP

Start with a learning decision.

TREE NODE

O00 / outcome / intended

EVIDENCE BOUNDARY

7 authored nodes: 1 outcome, 2 opportunities, 4 untested hypotheses.

Context Library is an invented concept for keeping a short note beside the passage that prompted it. Discovery asks whether the relationship is understandable before proposing a product roadmap.

The outcome O00 is to make the passage-note relationship inspectable. It is a design intention, not a measured improvement or evidence that a real audience needs this service.

Exploration charter

The tree has one outcome, two opportunity branches and four hypotheses. Its structure makes assumptions traceable without turning them into findings.

Figure 1 / fictional illustration, not evidence / curated image source in provenance.json

OUTCOME / OPPORTUNITY / HYPOTHESIS

Decision

Choose which uncertainty to investigate before implementation.

Boundary

No actual users, market demand or release commitment established.

Artifact

A versioned tree with questions attached to each hypothesis.

What decision could a small inquiry change?

02 / DISCOVERY MAP

Map a context without inventing a persona.

TREE NODE

O01 / opportunity / unvalidated

EVIDENCE BOUNDARY

7 authored nodes: 1 outcome, 2 opportunities, 4 untested hypotheses.

Imagine a reader returning to a note after the surrounding passage has been forgotten. The scenario identifies a possible context for inquiry, not a representative user profile.

Separate the moment of writing from the moment of return. A note that seems clear during writing may lack enough context later; that possibility requires investigation rather than an invented quotation.

Context map

Use the same invented passage across alternatives so that a changing example does not explain differences attributed to the design.

Figure 1 / fictional illustration, not evidence / curated image source in provenance.json

OUTCOME / OPPORTUNITY / HYPOTHESIS

Situation	Unknown	Control
A reader returns to a saved note and its source passage.	Whether the missing relationship is actually a recurring difficulty.	Hold passage, note and task wording constant across examples.

What distinguishes the writing moment from the return moment?

03 / DISCOVERY MAP

Describe the problem before a feature.

TREE NODE

O02 / opportunity / unvalidated

EVIDENCE BOUNDARY

7 authored nodes: 1 outcome, 2 opportunities, 4 untested hypotheses.

Opportunity O01 asks how a returning reader might recover relevant context. O02 asks how a reader might understand a note's revision status. Both are authored problem statements.

Neither branch requires a particular interface. A source excerpt, a reference link or a clear explanation could address O01 in different ways. Do not select a solution by how neatly it fits the tree.

Problem framing

A branch is worth keeping only if the proposed inquiry can reveal something about it. Remove redundant labels rather than counting more branches as progress.

Figure 2 / fictional illustration, not evidence / curated image source in provenance.json

OUTCOME / OPPORTUNITY / HYPOTHESIS

O01	O02	Exclusion
Recover the context needed to interpret a note.	Understand whether a note is provisional or revised.	No evidence that either opportunity represents a known population.

Could the problem still be discussed without naming a screen?

04 / DISCOVERY MAP

Keep the tree's parent links explicit.

TREE NODE

H11 / hypothesis / untested

EVIDENCE BOUNDARY

7 authored nodes: 1 outcome, 2 opportunities, 4 untested hypotheses.

O00 connects to O01 and O02. Hypotheses H11 and H12 belong to O01; H21 and H22 belong to O02. Every non-root node has exactly one parent.

A single parent keeps this small teaching tree readable. It does not claim that real needs are independent. Cross-cutting uncertainty belongs in a note rather than a duplicate node presented as new evidence.

Opportunity branches

The source register stores seven nodes with unique IDs. Parent references must exist, and traversing them must reach O00 without a cycle.

Figure 2 / fictional illustration, not evidence / curated image source in provenance.json

OUTCOME / OPPORTUNITY / HYPOTHESIS

Root	Children	Leaves
O00, an intended outcome rather than a metric.	O01 and O02, both unvalidated opportunities.	H11, H12, H21 and H22, all untested hypotheses.

Can another reader reconstruct the tree from the register alone?

05 / DISCOVERY MAP

Make each hypothesis refutable.

TREE NODE

H12 / hypothesis / untested

EVIDENCE BOUNDARY

7 authored nodes: 1 outcome, 2 opportunities, 4 untested hypotheses.

H11 proposes that an adjacent source excerpt helps recover context. H12 proposes that an explicit source link does so. Neither is a claim that one treatment works.

H21 proposes that a visible revision label helps explain status. H22 proposes that a brief change note helps explain what changed. A reader may misunderstand either treatment even when the designer finds it obvious.

Solution hypotheses

An inquiry should allow a treatment to be confusing or unnecessary. A question that only asks which version looks attractive cannot establish comprehension.

Figure 3 / fictional illustration, not evidence / curated image source in provenance.json

OUTCOME / OPPORTUNITY / HYPOTHESIS

H11 / H12	H21 / H22	Status
Compare an excerpt and a source link for context recovery.	Compare a status label and a change note for revision meaning.	All four remain untested; no actual outcomes recorded.

What observation would make this hypothesis less plausible?

06 / DISCOVERY MAP

Ask a question that does not supply its answer.

TREE NODE

H21 / hypothesis / untested

EVIDENCE BOUNDARY

7 authored nodes: 1 outcome, 2 opportunities, 4 untested hypotheses.

A useful research question asks how a reader explains the relation between a note and its passage. It does not ask whether the new context feature is helpful.

Prepare prompts that allow uncertainty, disagreement and an unexpected explanation. Ask what the person inspected before naming the intended cue; otherwise the prompt may teach the answer being evaluated.

Question design

Keep the researcher's hypothesis outside the initial task. Record later clarification separately from an unaided interpretation.

Figure 3 / fictional illustration, not evidence / curated image source in provenance.json

OUTCOME / OPPORTUNITY / HYPOTHESIS

Prompt	Probe	Avoid
Explain what the note refers to and what remains unclear.	Which part of the artifact informed that interpretation?	Do not ask whether the proposed improvement is successful.

Would the wording still make sense if the hypothesis were wrong?

07 / DISCOVERY MAP

Match the method to the uncertainty.

TREE NODE

H22 / hypothesis / untested

EVIDENCE BOUNDARY

7 authored nodes: 1 outcome, 2 opportunities, 4 untested hypotheses.

A small artifact walkthrough could explore whether the connection is understandable. It would not establish market size, sustained use or a statistically reliable preference between treatments.

Show a paper concept or a clearly bounded prototype, describe what it can and cannot do, and use an appropriate participation arrangement. This document schedules no actual session or recruitment.

Method boundary

An unimplemented control cannot support a conclusion about its response time or reliability. Keep concept interpretation separate from functional usability.

Figure 4 / fictional illustration, not evidence / curated image source in provenance.json

OUTCOME / OPPORTUNITY / HYPOTHESIS

Method	Observation	Limit
An optional future walkthrough of two authored alternatives.	Record interpretation and the cue used, not just preference.	No actual sessions, recruitment or longitudinal evidence exist.

What could this method legitimately teach?

08 / DISCOVERY MAP

Record a trade-off as a hypothesis too.

TREE NODE

O00 / outcome / intended

EVIDENCE BOUNDARY

7 authored nodes: 1 outcome, 2 opportunities, 4 untested hypotheses.

An excerpt might preserve context while making the card longer. A link might keep the card compact while requiring another step. These are design tensions, not measured costs.

Choose what the next inquiry needs to distinguish. A temporary choice can narrow an experiment without becoming an approved product direction. Explain why the other alternative is retained or deferred.

Trade-off record

Do not give invented reach, confidence or effort scores to make a choice look objective. Unknown evidence stays unknown.

Figure 4 / fictional illustration, not evidence / curated image source in provenance.json

OUTCOME / OPPORTUNITY / HYPOTHESIS

Candidate	Reason	Revisit
Explore the adjacent excerpt first for a bounded walkthrough.	The relationship is visible without another navigation step.	Retain the link alternative until interpretation has been examined.

Which assumption carries the temporary decision?

09 / DISCOVERY MAP

Keep a learning ledger separate from the tree.

TREE NODE

O01 / opportunity / unvalidated

EVIDENCE BOUNDARY

7 authored nodes: 1 outcome, 2 opportunities, 4 untested hypotheses.

The authored tree contains no observed findings. A later ledger should link an observation to its task, artifact version, source permission and the hypothesis it informs.

A single comment should not silently become a finding about everyone. Preserve counterexamples and distinguish what was said from a researcher's explanation of why it happened.

Learning synthesis

A hypothesis can remain uncertain after a useful session. Avoid treating the completion of research activities as validation.

Figure 5 / fictional illustration, not evidence / curated image source in provenance.json

OUTCOME / OPPORTUNITY / HYPOTHESIS

Current	Future	Rule
Four untested hypotheses and no collected observations.	Link any permitted observation to task and artifact version.	Separate raw observation, interpretation and proposed action.

What source would justify changing a node's status?

10 / DISCOVERY MAP

Choose the next question, not a launch date.

TREE NODE

O02 / opportunity / unvalidated

EVIDENCE BOUNDARY

7 authored nodes: 1 outcome, 2 opportunities, 4 untested hypotheses.

The next step is to prepare a bounded comparison for O01 and review whether its task wording exposes the intended uncertainty. No real release date or staffing commitment follows.

Check the tree, the source boundary and the planned participation process before any study. Keep O02 visible so that a convenient first inquiry does not erase the revision-status question.

Exploration handoff

Share the source register and the reason for the next inquiry. A successor should be able to disagree without reconstructing missing assumptions.

Figure 5 / fictional illustration, not evidence / curated image source in provenance.json

OUTCOME / OPPORTUNITY / HYPOTHESIS

Next

Prepare a clearly labeled excerpt-versus-link concept comparison.

Open

Revision meaning, real contexts and long-term usefulness remain unknown.

Handoff

Carry the tree version, scope exclusions and unanswered questions.

What remains unlearned after this workbook?
